We often model synaptic plasticity as the change of a single number (synaptic weight). In reality, there is a complex dynamical system inside a synapse.

Semi-realistic models of synaptic plasticity have terrible memory without synaptic complexity.

We will study the entire space of a broad class of models of complex synapses to find upper bounds on their performance.

2013-06-07

Complex synapses

└ Introduction

1. amplitude of psp.
2. finite number of values.

We often model synaptic plasticity as the change of a single number (synaptic weight). In reality, there is a complex dynamical system inside a synapse.

Semi-realistic models of synaptic plasticity have terrible memory without synaptic complexity.

We will study the entire space of a broad class of models of complex synapses to find upper bounds on their performance.

└ Concepts

Learning rule: how activity \rightarrow potentiation/depression.
e.g. Hebb rule, STDP, Hopfield outer product, perceptron rule,...

Plasticity mechanism: how synapse responds to potentiation/depression.
e.g. Binary switch, Cascade model, Multistate model,...

Memory retrieval: how synaptic state affects neural activity.
e.g. Hopfield attractor,...

Learning rule: how activity \rightarrow potentiation/depression.

e.g. Hebb rule, STDP, Hopfield outer product, perceptron rule,...

Plasticity mechanism: how synapse responds to potentiation/depression.

e.g. Binary switch, Cascade model, Multistate model,...

Memory retrieval: how synaptic state affects neural activity.

e.g. Hopfield attractor,...

1. Avoid confusion: separate concepts
2. Talk exclusively about second one.
3. Abstract away other two.

Why complex synapses?

Section 1

Why complex synapses?

Complex synapse

[Coba et al. (2009)]

There is a complex, dynamical molecular network underlying synaptic plasticity.

2013-06-07

Complex synapses

- Why complex synapses?

- Complex synapse

1. Molecular network, post-synaptic density, from Seth Grant
2. Does this matter?
3. Could just be the machinery for changing synaptic weight
4. link back to questions on "There"

Storage capacity of synaptic memory

A classical perceptron (used as a recognition memory device) has a capacity $\propto N$, the number of synapses.

Requires synapses' dynamic range also $\propto N$.

If we restrict synaptic weight to a fixed, finite set of values,
 \implies tradeoff between learning and forgetting:
new memories overwriting old.

If we wish to store new memories rapidly, memory capacity $\sim \mathcal{O}(\log N)$.
[Amit and Fusi (1992), Amit and Fusi (1994)]

To circumvent this tradeoff, need to go beyond model of a synapse as a single number.

2013-06-07

Complex synapses

└ Why complex synapses?

└ Storage capacity of synaptic memory

1. very plastic: learn easy, forget easy
2. little plasticity, remember better, learn harder
3. or sparse $\sim \log N/N$
4. one way around limit: complexity

- Complex synapses

Modelling synaptic complexity

Modelling synaptic complexity

2013-06-07

Complex synapses

└ Modelling synaptic complexity

└ Complex synapses

1. functional states, not molecules
2. synaptic weight depends on state
3. many states can have same weight
4. stochastic transitions

- No spatial/temporal correlations in plasticity events.
- Potentiating/depressing plasticity events \sim Poisson processes.
- Potentiation and depression are described by Markov processes.
- Ideal observer: read weights directly.
- Synaptic weights can only take values ± 1 .

[Fusi et al. (2005), Fusi and Abbott (2007), Barrett and van Rossum (2008)]

2013-06-07

Complex synapses

└ Modelling synaptic complexity

└ Simplifying assumptions

1. allows us to concentrate on synapse, not neuron/network
2. No firing system
3. don't care if STDP...
4. not electrical activity: don't model neurons/network
5. upper bound on electrical activity readout
6. looks like binary synapse from outside. Inside...

- No spatial/temporal correlations in plasticity events.
 - Potentiating/depressing plasticity events \sim Poisson processes.
 - Potentiation and depression are described by Markov processes.
 - Ideal observer: read weights directly.
 - Synaptic weights can only take values ± 1 .
- [Fusi et al. (2005), Fusi and Abbott (2007), Barrett and van Rossum (2008)]

There are N identical synapses with M internal functional states.

$$\frac{d\mathbf{p}(t)}{dt} = r\mathbf{p}(t)\mathbf{W}^F, \quad \mathbf{W}^F = f^{\text{pot}}\mathbf{M}^{\text{pot}} + f^{\text{dep}}\mathbf{M}^{\text{dep}} - \mathbf{I},$$

$$\mathbf{p}^\infty \mathbf{W}^F = 0.$$

2013-06-07

Complex synapses

└ Modelling synaptic complexity

└ Dynamics

Dynamics

There are N identical synapses with M internal functional states.

$$\frac{d\mathbf{p}(t)}{dt} = r\mathbf{p}(t)\mathbf{W}^F, \quad \mathbf{W}^F = f^{\text{pot}}\mathbf{M}^{\text{pot}} + f^{\text{dep}}\mathbf{M}^{\text{dep}} - \mathbf{I},$$

$$\mathbf{p}^\infty \mathbf{W}^F = 0.$$

1. stoch process has steady state.
2. Prior activity puts it in this state. row vec.
3. plasticity events at rate r
4. fraction pot/dep
5. probs changed by Markov matrices, prob $i \rightarrow j$
6. Readout: synaptic weight vec when in each state.
7. Memory at $t = 0$, keep track of pot/dep
8. subsequent: average over pot/dep

\vec{w} is the N -element vector of synaptic weights.

$$\text{Signal} = \langle \vec{w}_{\text{ideal}} \cdot \vec{w}(t) - \vec{w}_{\text{ideal}} \cdot \vec{w}(\infty) \rangle,$$

$$\text{Noise} = \sqrt{\text{Var}(\vec{w}_{\text{ideal}} \cdot \vec{w}(\infty))} \sim \sqrt{N}.$$

We find:

$$\text{SNR}(t) = \sqrt{N}(2f^{\text{pot}}f^{\text{dep}}) \mathbf{p}^{\infty} (\mathbf{M}^{\text{pot}} - \mathbf{M}^{\text{dep}}) \exp(rt\mathbf{W}^{\text{F}}) \mathbf{w}.$$

\vec{w} is the N -element vector of synaptic weights.

$$\text{Signal} = \langle \vec{w}_{\text{ideal}} \cdot \vec{w}(t) - \vec{w}_{\text{ideal}} \cdot \vec{w}(\infty) \rangle,$$

$$\text{Noise} = \sqrt{\text{Var}(\vec{w}_{\text{ideal}} \cdot \vec{w}(\infty))} \sim \sqrt{N}.$$

We find:

$$\text{SNR}(t) = \sqrt{N}(2f^{\text{pot}}f^{\text{dep}}) \mathbf{p}^{\infty} (\mathbf{M}^{\text{pot}} - \mathbf{M}^{\text{dep}}) \exp(rt\mathbf{W}^{\text{F}}) \mathbf{w}.$$

1. of different synapses
2. ideal observer reads weights, not states
3. upper bound on electrical activity readout
4. ideal: pot→strong...
5. use $\vec{w}_{\text{ideal}} \cdot \vec{w}(\infty)$ as null model
6. Noise: ignore correction when asymmetric. No effect.
7. Using \mathbf{W}^{F} averages over pot/dep sequence (proof: expand)

Example models

Two example models of complex synapses.

[Fusi et al. (2005), Leibold and Kempster (2008)]

These have different memory storage properties

Complex synapses

└ Modelling synaptic complexity

└ Example models

1. previous work, also: Benna-Fusi
2. Multistate good at one time, bad at others,
3. Cascade, less well at that time, better over range of times.

- Can we understand the space of *all possible* synaptic models?
- How does structure (topology) of model \rightarrow function (memory curve)?
- What are the limits on what can be achieved?
- Which transition topologies saturate these limits?

└ Modelling synaptic complexity

└ Questions

Questions

- Can we understand the space of all possible synaptic models?
- How does structure (topology) of model \rightarrow function (memory curve)?
- What are the limits on what can be achieved?
- Which transition topologies saturate these limits?

1. not just individual models
2. understand net (link on topology)
3. avoid using word “optimal”. depends on what want to do.

Memory curve given by

$$\text{SNR}(t) = \sqrt{N}(2f^{\text{pot}}f^{\text{dep}}) \mathbf{p}^\infty \left(\mathbf{M}^{\text{pot}} - \mathbf{M}^{\text{dep}} \right) \exp \left(rt \mathbf{W}^F \right) \mathbf{w}.$$

Constraints: $\mathbf{M}_{ij}^{\text{pot/dep}} \in [0, 1], \quad \sum_j \mathbf{M}_{ij}^{\text{pot/dep}} = 1.$

Eigenmode decomposition:

$$\text{SNR}(t) = \sqrt{N} \sum_a \mathcal{I}_a e^{-rt/\tau_a}.$$

2013-06-07

Complex synapses

└ Modelling synaptic complexity

└ Constraints

1. prefactors don't do anything, ignore
2. prior state, encoding, forgetting, readout
3. difficult to to apply
4. what are constraints on these?

Memory curve given by

$$\text{SNR}(t) = \sqrt{N}(2f^{\text{pot}}f^{\text{dep}}) \mathbf{p}^\infty \left(\mathbf{M}^{\text{pot}} - \mathbf{M}^{\text{dep}} \right) \exp \left(rt \mathbf{W}^F \right) \mathbf{w}.$$

Constraints: $\mathbf{M}_{ij}^{\text{pot/dep}} \in [0, 1], \quad \sum_j \mathbf{M}_{ij}^{\text{pot/dep}} = 1.$

Eigenmode decomposition:

$$\text{SNR}(t) = \sqrt{N} \sum_a \mathcal{I}_a e^{-rt/\tau_a}.$$

Section 3

Upper bounds

Initial SNR as flux

Initial SNR is closely related to flux between strong & weak states

$$\text{SNR}(0) \leq \frac{4\sqrt{N}}{r} \Phi_{-+}.$$

Max when potentiation guarantees $\mathbf{w} \rightarrow +1$,
depression guarantees $\mathbf{w} \rightarrow -1$.

2013-06-07

Complex synapses

└ Upper bounds

└ Initial SNR

└ Initial SNR as flux

Initial SNR as flux

Initial SNR is closely related to flux between strong & weak states

$$\text{SNR}(0) \leq \frac{4\sqrt{N}}{r} \Phi_{-+}.$$

Max when potentiation guarantees $\mathbf{w} \rightarrow +1$,
depression guarantees $\mathbf{w} \rightarrow -1$.

1. flux = eq prob \times trans prob
2. usually saturated: pot never dec, dep never inc
3. transitions out of one node sum to 1
4. equivalent to two-state model: doesn't matter which strong/weak state, same prob of going to other set.

Two-state model

Two-state model equivalent to previous slide:

Maximal initial SNR:

$$\text{SNR}(0) \leq \sqrt{N}.$$

2013-06-07

Complex synapses
└ Upper bounds
└ Initial SNR
└ Two-state model

Two-state model

Two-state model equivalent to previous slide:

Maximal initial SNR:

$$\text{SNR}(0) \leq \sqrt{N}.$$

1. decays very quickly
2. $f^{\text{pot}} = \frac{1}{2}$
3. Initial SNR not a good thing to optimise.

Area under memory curve

Memory lifetime bounded by area under SNR curve:

$$\text{SNR}(\text{lifetime}) = 1 \\ \Rightarrow \text{lifetime} < \mathcal{A}.$$

This area has an upper bound:

$$\mathcal{A} \leq \sqrt{N}(M-1)/r.$$

Saturated by a model with linear chain topology.

2013-06-07

Complex synapses

└ Upper bounds

└ Area under memory curve

└ Area under memory curve

Area under memory curve

Memory lifetime bounded by area under SNR curve:

$$\text{SNR}(\text{lifetime}) = 1 \\ \Rightarrow \text{lifetime} < \mathcal{A}.$$

This area has an upper bound:

$$\mathcal{A} \leq \sqrt{N}(M-1)/r.$$

Saturated by a model with linear chain topology.

1. lifetime = area under green j area under blue
2. capacity $\sim r$ lifetime, #new memories before we forget original.
3. reminder: $N = \text{\#synapses}$, $M = \text{\#states}$
4. proof next slide

Proof of area bound

For any model, we can construct perturbations that

- preserve equilibrium distribution,
- increase area.

details

e.g. decrease “shortcut” transitions, increase bypassed “direct” ones.
Endpoint: linear chain

The area of this model is

$$A = \frac{2\sqrt{N}}{r} \sum_k \mathbf{p}_k^\infty |k - \langle k \rangle|.$$

Max: equilibrium probability distribution concentrated at both ends.

[Barrett and van Rossum (2008)]
