May 10, 2013

We often model synaptic plasticity as the change of a single number (synaptic weight). In reality, there is a complex dynamical system inside a synapse.

Semi-realistic models of synaptic memory have terrible storage without synaptic complexity.

We will study the entire space of a broad class of models of complex synapses to find upper bounds on their performance.

2013-05-10

Complex synapses

└ Introduction

1. amplitude of psp.
2. finite number of values.

We often model synaptic plasticity as the change of a single number (synaptic weight). In reality, there is a complex dynamical system inside a synapse.

Semi-realistic models of synaptic memory have terrible storage without synaptic complexity.

We will study the entire space of a broad class of models of complex synapses to find upper bounds on their performance.

1 Why complex synapses?

2 Modelling synaptic complexity

3 Upper bounds

4 Envelope memory curve

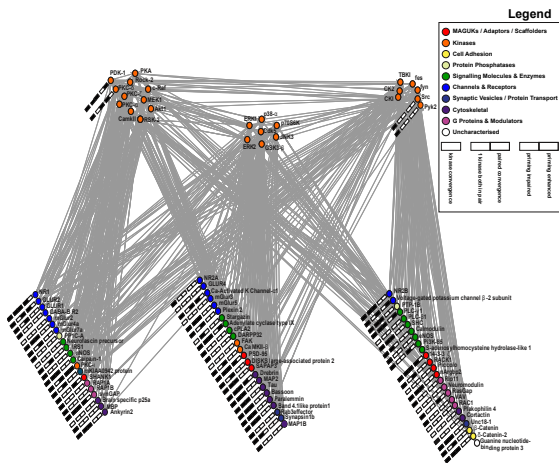

1. review terrible properties of simple synapses.
2. mathematical formalism of model, quantify performance (memory decay over time)
3. upper bounds on single numbers that depend on whole memory curve (decay over time)
4. upper bounds at finite times

Complex synapses
└ Why complex synapses?

Why complex synapses?

Why complex synapses?

Complex synapse

[Coba et al. (2009)]

There is a complex, dynamical molecular network underlying synaptic plasticity.

2013-05-10

Complex synapses

- Why complex synapses?
- Complex synapse

1. Molecular network, post-synaptic density, from Seth Grant
2. Does this matter?
3. Could just be the machinery for changing synaptic weight
4. link back to questions on "There"

Storage capacity of synaptic memory

A classical perceptron (used as a recognition memory device) has a capacity $\propto N$, the number of synapses.

Requires synapses' dynamic range also $\propto N$.

If we restrict synaptic weight to a fixed, finite set of values,
 \implies tradeoff between learning and forgetting:
new memories overwriting old.

If we wish to store new memories rapidly, memory capacity $\sim \mathcal{O}(\log N)$.
[Amit and Fusi (1992), Amit and Fusi (1994)]

To circumvent this tradeoff, need to go beyond model of a synapse as a single number.

2013-05-10

Complex synapses

└ Why complex synapses?

└ Storage capacity of synaptic memory

1. very plastic: learn easy, forget easy
2. little plasticity, remember better, learn harder
3. or sparse $\sim \log N/N$
4. one way around limit: complexity

2013-05-10

Complex synapses

Section 2

Modelling synaptic complexity

2013-05-10

Complex synapses

└ Modelling synaptic complexity

└ Complex synapses

1. functional states, not molecules
2. synaptic weight depends on state
3. many states can have same weight
4. stochastic transitions

Simplifying assumptions

- There are N identical synapses with M internal functional states.
- States of different synapses are independent of each other.
- Which synapses eligible for plasticity chosen randomly.
- Potentiating/depressing plasticity events \sim Poisson processes with rates $rf^{\text{pot/dep}}$, where $f^{\text{pot}} + f^{\text{dep}} = 1$.
- Potentiation and depression are described by Markov processes with transition probabilities $\mathbf{M}^{\text{pot/dep}}$.
- Synaptic weights of the internal states are given by vector \mathbf{w} .
Can only take values ± 1 .

2013-05-10

Complex synapses

└ Modelling synaptic complexity

└ Simplifying assumptions

Simplifying assumptions

- There are N identical synapses with M internal functional states.
- States of different synapses are independent of each other.
- Which synapses eligible for plasticity chosen randomly.
- Potentiating/depressing plasticity events \sim Poisson processes with rates $rf^{\text{pot/dep}}$, where $f^{\text{pot}} + f^{\text{dep}} = 1$.
- Potentiation and depression are described by Markov processes with transition probabilities $\mathbf{M}^{\text{pot/dep}}$.
- Synaptic weights of the internal states are given by vector \mathbf{w} .
Can only take values ± 1 .

1. allows us to concentrate on synapse, not neuron/network
2. don't care if STDP...
3. r = total rate of plasticity events per synapse, $f^{\text{pot/dep}}$ = fraction of events that are potentiating/depressing.
4. matrix elements: transition prob from $i \rightarrow j$, given pot/dep
5. looks like binary synapse from outside. Inside...
6. ideal observer reads weights, not electrical activity: don't model neurons/network
7. upper bound on electrical activity readout

$$\frac{d\mathbf{p}(t)}{dt} = r\mathbf{p}(t)\mathbf{W}^F, \quad \mathbf{W}^F = f^{\text{pot}}\mathbf{M}^{\text{pot}} + f^{\text{dep}}\mathbf{M}^{\text{dep}} - \mathbf{I},$$

$$\mathbf{p}^\infty \mathbf{W}^F = 0.$$

At $t = 0$, the memory is created by $\mathbf{M}^{\text{pot/dep}}$ with probability $f^{\text{pot/dep}}$.

Forgetting caused by subsequent memories, evolving as

$$\frac{d\mathbf{p}(t)}{dt} = r\mathbf{p}(t)\mathbf{W}^F, \quad \mathbf{W}^F = f^{\text{pot}}\mathbf{M}^{\text{pot}} + f^{\text{dep}}\mathbf{M}^{\text{dep}} - \mathbf{I},$$

Eventually, this will settle into the equilibrium distribution:

$$\mathbf{p}^\infty \mathbf{W}^F = 0.$$

1. for this one, we keep track of pot/dep, look for inc/dec of \mathbf{w}
2. \mathbf{W}^F is forgetting matrix, \mathbf{I} = identity, don't keep track of pot/dep
3. In equilibrium prior to memory creation

\vec{w} is the N -element vector of synaptic weights.

$$\text{Signal} = \langle \vec{w}_{\text{ideal}} \cdot \vec{w}(t) - \vec{w}_{\text{ideal}} \cdot \vec{w}(\infty) \rangle,$$

$$\text{Noise} = \sqrt{\text{Var}(\vec{w}_{\text{ideal}} \cdot \vec{w}(\infty))}.$$

Related to reconstruction probability of single synapses.

$$\text{SNR}(t) \sim \sqrt{N} P(\text{strong/weak}, t | \text{pot/dep}, t=0) - \dots (t=\infty).$$

1. of different synapses
2. ideal observer reads weights, not states
3. upper bound on electrical activity readout
4. ideal: pot→strong...
5. subtract baseline, some overlap even w/o encoding
6. if we ignore correlations...

Example models

Two example models of complex synapses.

Multistate model

Cascade model

[Amit and Fusi (1994), Fusi and Abbott (2007), Fusi et al. (2005)]

These have different memory storage properties

2013-05-10

Complex synapses

└ Modelling synaptic complexity

└ Example models

1. previous work, also: Benna-Fusi
2. Multistate good at one time, bad at others,
3. Cascade, less well at that time, better over range of times.

- Can we understand the space of *all possible* synaptic models?
- How does structure (topology) of model \rightarrow function (memory curve)?
- What are the limits on what can be achieved?
- Which transition topologies saturate these limits?

2013-05-10

└─Modelling synaptic complexity

└─Questions

Questions

- Can we understand the space of all possible synaptic models?
- How does structure (topology) of model \rightarrow function (memory curve)?
- What are the limits on what can be achieved?
- Which transition topologies saturate these limits?

1. not just individual models
2. understand net (link on topology)
3. avoid using word “optimal”. depends on what want to do.

Memory curve given by

$$\text{SNR}(t) = \frac{\sqrt{N}(2f^{\text{pot}}f^{\text{dep}})}{\sqrt{4\mathbf{p}_+^\infty \mathbf{p}_-^\infty}} \mathbf{p}^\infty \left(\mathbf{M}^{\text{pot}} - \mathbf{M}^{\text{dep}} \right) \exp \left(rt \mathbf{W}^F \right) \mathbf{w}.$$

Constraints: $\mathbf{M}_{ij}^{\text{pot/dep}} \in [0, 1], \quad \sum_j \mathbf{M}_{ij}^{\text{pot/dep}} = 1.$

Eigenmode decomposition:

$$\text{SNR}(t) = \sqrt{N} \sum_a \mathcal{I}_a e^{-rt/\tau_a}.$$

2013-05-10

Complex synapses

└ Modelling synaptic complexity

└ Memory curve 2

1. prefactors don't do anything, ignore
2. prior state, encoding, forgetting, readout
3. difficult to to apply
4. what are constraints on these?

Memory curve given by

$$\text{SNR}(t) = \frac{\sqrt{N}(2f^{\text{pot}}f^{\text{dep}})}{\sqrt{4\mathbf{p}_+^\infty \mathbf{p}_-^\infty}} \mathbf{p}^\infty \left(\mathbf{M}^{\text{pot}} - \mathbf{M}^{\text{dep}} \right) \exp \left(rt \mathbf{W}^F \right) \mathbf{w}.$$

Constraints: $\mathbf{M}_{ij}^{\text{pot/dep}} \in [0, 1], \quad \sum_j \mathbf{M}_{ij}^{\text{pot/dep}} = 1.$

Eigenmode decomposition:

$$\text{SNR}(t) = \sqrt{N} \sum_a \mathcal{I}_a e^{-rt/\tau_a}.$$

Initial SNR as flux

Initial SNR is closely related to flux between strong & weak states

$$\text{SNR}(0) \leq \frac{4\sqrt{N}}{r} \Phi_{-+}.$$

Max when potentiation guarantees $\mathbf{w} \rightarrow +1$,
depression guarantees $\mathbf{w} \rightarrow -1$.

2013-05-10

Complex synapses

└ Upper bounds

└ Initial SNR

└ Initial SNR as flux

Initial SNR as flux

Initial SNR is closely related to flux between strong & weak states

$$\text{SNR}(0) \leq \frac{4\sqrt{N}}{r} \Phi_{-+}.$$

Max when potentiation guarantees $\mathbf{w} \rightarrow +1$,
depression guarantees $\mathbf{w} \rightarrow -1$.

1. flux = eq prob \times trans prob
2. usually saturated: pot never dec, dep never inc
3. transitions out of one node sum to 1
4. equivalent to two-state model: doesn't matter which strong/weak state, same prob of going to other set.

Two-state model

Two-state model equivalent to previous slide:

Maximal initial SNR:

$$\text{SNR}(0) \leq \sqrt{N}.$$

2013-05-10

Complex synapses
└ Upper bounds
└ Initial SNR
└ Two-state model

Two-state model

Two-state model equivalent to previous slide:

Maximal initial SNR:

$$\text{SNR}(0) \leq \sqrt{N}.$$

1. decays very quickly
2. $f^{\text{pot}} = \frac{1}{2}$
3. Initial SNR not a good thing to optimise.

Area under memory curve

Memory lifetime bounded by area under SNR curve:

$$\text{SNR}(\text{lifetime}) = 1 \\ \Rightarrow \text{lifetime} < \mathcal{A}.$$

This area has an upper bound:

$$\mathcal{A} \leq \sqrt{N(M-1)}/r.$$

Saturated by a model with linear chain topology.

2013-05-10

Complex synapses

$$\text{SNR}(\text{lifetime}) = 1 \\ \Rightarrow \text{lifetime} < \mathcal{A}.$$

This area has an upper bound:

$$\mathcal{A} \leq \sqrt{N(M-1)}/r.$$

Saturated by a model with linear chain topology.

1. lifetime = area under green | area under blue
2. capacity $\sim r$ lifetime, #new memories before we forget original.
3. reminder: $N = \text{\#synapses}$, $M = \text{\#states}$
4. proof next slide

Proof of area bound

For any model, we can construct perturbations that

- preserve equilibrium distribution,
- increase area.

details

e.g. decrease “shortcut” transitions, increase bypassed “direct” ones.
Endpoint: linear chain

The area of this model is

$$A = \frac{2\sqrt{N}}{r} \sum_k \mathbf{p}_k^\infty |k - \langle k \rangle|.$$

Max: equilibrium probability distribution concentrated at both ends.

[Barrett and van Rossum (2008)]

Best models at single times

Early times:

Late times:

2013-05-10

Complex synapses

└ Envelope memory curve

└ Best models at single times

Best models at single times

Early times:

Late times:

1. shorten length of chain, keeping deterministic
2. Area maximising.
3. two mechs for slowing forgetting: time (lower trans prob) and space (diffusion length)

Conjecture: additional constraint

$$\mathcal{I}_a \sqrt{\tau_a} \leq \mathcal{O}(1).$$

Saturated by a diffusive chain:

$$\text{SNR}(0) \sim \frac{1}{M}, \quad \text{time-scale} \sim M^2.$$

1. Tested experimentally. Discuss later

$$\begin{aligned}
 rt < \mathcal{O}(M^2), & \quad \text{envelope} \sim (rt)^{-1/2}, \\
 rt > \mathcal{O}(M^2), & \quad \text{envelope} \sim (rt)^{-1}.
 \end{aligned}$$

2013-05-10

Complex synapses

└ Envelope memory curve

└ Envelope 2

$$\begin{aligned}
 rt < \mathcal{O}(M^2), & \quad \text{envelope} \sim (rt)^{-1/2}, \\
 rt > \mathcal{O}(M^2), & \quad \text{envelope} \sim (rt)^{-1}.
 \end{aligned}$$

1. dashed: conjecture. tight.
2. earlier: diffusion limited. later: stochastic limited.
3. regions: init(1); sqrt(2,3); area(3,4)
4. Benna-Fusi hugs envelope? cascade $\sim t^{-3/4}$

Lifetime of a memory bounded by where envelope crosses 1

$$N > \mathcal{O}(M^2) \implies \text{lifetime} \leq \frac{\sqrt{N}(M-1)}{er},$$

$$N < \mathcal{O}(M^2) \implies \text{lifetime} \leq \frac{\gamma^2 N}{2er}.$$

2013-05-10

Complex synapses

└ Envelope memory curve

└ Lifetime bound

Lifetime of a memory bounded by where envelope crosses 1

$$N > \mathcal{O}(M^2) \implies \text{lifetime} \leq \frac{\sqrt{N}(M-1)}{er},$$

$$N < \mathcal{O}(M^2) \implies \text{lifetime} \leq \frac{\gamma^2 N}{2er}.$$

1. $\gamma \sim \mathcal{O}(1)$ constant in additional constant
2. First t^{-1} assumes M low. Second $t^{-1/2}$ applies to Benna-Fusi.
3. Independent synapses?

Additional constraint: other forms?

Involving eigenmodes:

$$\mathcal{I}_a \sqrt{\tau_a}, \quad \sum_a \mathcal{I}_a \sqrt{\tau_a}, \quad \sum_a \mathcal{I}_a^2 \tau_a.$$

Not involving eigenmodes

$$\mathcal{A} \times \text{SNR}(0), \quad \int dt \text{SNR}(t)^2.$$

2013-05-10

Complex synapses

└ Envelope memory curve

└ Additional constraint: other forms?

Involving eigenmodes:

$$\mathcal{I}_a \sqrt{\tau_a}, \quad \sum_a \mathcal{I}_a \sqrt{\tau_a}, \quad \sum_a \mathcal{I}_a^2 \tau_a.$$

Not involving eigenmodes

$$\mathcal{A} \times \text{SNR}(0), \quad \int dt \text{SNR}(t)^2.$$

1. as one-time max only involved one exp, would also work
2. right units
3. easier to work with?
4. L2 doesn't have nice expression in terms of matrices

Cheeger inequality

Cheeger constant:

$$\phi \equiv \min_S \left\{ \frac{\text{Perimeter}(\partial S)}{\text{Area}(S)} \right\}.$$

Timescale for diffusion to equilibrate

$$\frac{1}{D\tau_{\text{diffusion}}} > \mathcal{O}(1) \phi^2.$$

2013-05-10

Complex synapses

└ Envelope memory curve

└ Cheeger inequality

Cheeger inequality

Cheeger constant:

$$\phi = \min_S \left\{ \frac{\text{Perimeter}(\partial S)}{\text{Area}(S)} \right\}.$$

Timescale for diffusion to equilibrate

$$\frac{1}{D\tau_{\text{diffusion}}} > \mathcal{O}(1) \phi^2.$$

1. split into two pieces. pick smaller. higher dim.
2. bottleneck
3. if we want slow diffusion, need lhs small \rightarrow need bottleneck.
4. purely geometric
5. also inequality in other direction: want slow diffusion \rightarrow need bottleneck.
Not useful for us

Cheeger constant:

$$\phi \equiv \min_{\mathcal{S}} \left\{ \frac{\Phi_{\mathcal{S}\mathcal{S}^c}}{\mathbf{p}^\infty(\mathcal{S})} \right\}.$$

Timescale to equilibrate:

$$\frac{1}{\max_a \tau_a} > \mathcal{O}(1) \phi^2.$$

Simple proof assuming detailed balance.
More complicated proof for general case.

[Sinclair and Jerrum (1989)]
[Lawler and Sokal (1988)]

2013-05-10

Complex synapses

Envelope memory curve

- └ Cheeger inequality: Markov chains

$$\phi = \min_S \left\{ \frac{\Phi_{SS^c}}{p^{\infty}(S)} \right\}.$$
$$\frac{1}{\max_j \tau_j} \geq \mathcal{O}(1) \phi^2.$$

[Lawler and Sokal (1988)]

1. split states into two subsets. pick smaller.
2. again bottleneck
3. denominator varies
4. $\mathcal{O}(1)$ bit differs
5. bottleneck need not be between strong & weak.

Counter examples?

Put bottleneck somewhere else:

Set $\epsilon = 1/M$, see how putative constraints vary:

Also tried: random Markov chains.

Technical detail: ordering states

Let \mathbf{T}_{ij} = mean first passage time from state i to state j . Then:

$$\eta = \sum_j \mathbf{T}_{ij} \mathbf{p}_j^\infty,$$

is independent of the initial state i (Kemeney's constant).

[Kemeny and Snell (1960)]

We define:

$$\eta_i^+ = \sum_{j \in \text{strong}} \mathbf{T}_{ij} \mathbf{p}_j^\infty, \quad \eta_i^- = \sum_{j \in \text{weak}} \mathbf{T}_{ij} \mathbf{p}_j^\infty.$$

They can be used to arrange the states in an order (increasing η^- or decreasing η^+). [back](#)

Technical detail: upper/lower triangular

With states in order:

Endpoint: potentiation goes right, depression goes left.

Technical detail: upper/lower triangular

With states in order:

Endpoint: potentiation goes right, depression goes left.

1. pot & dep with same initial & final state
2. pot/dep matrices are upper/lower triangular.
3. one other pert. too technical, even for bonus slide!
