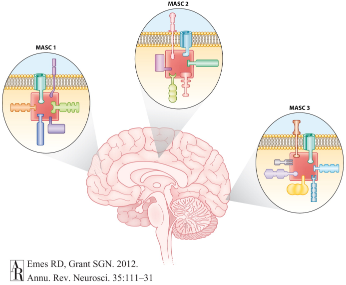
[Cooke et al. (2004)]

Different synapses have different molecular structures.

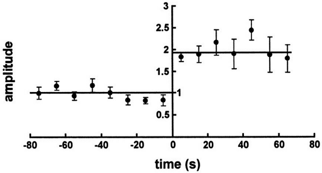


[Emes and Grant (2012)]

Storage capacity of synaptic memory

A classical perceptron has a capacity $\propto N$, ($\#$ synapses).

Requires synapses' dynamic range also $\propto N$.



With discrete, finite synapses:
$\implies$ new memories overwrite old,
$\implies$ stability-plasticity dilemma.

[Petersen et al. (1998), O'Connor et al. (2005)]

When we store new memories rapidly, memory capacity $\sim \mathcal{O}(\log N)$.

[Amit and Fusi (1992), Amit and Fusi (1994)]

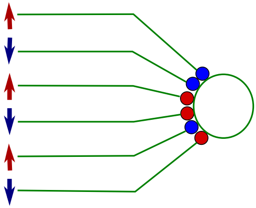
Compare $\vec{s} \cdot \vec{w}(t)$ to threshold. [Sommer and Dayan (1998)]

Recognition memory

Synapses given a sequence of patterns (pot & dep) to store

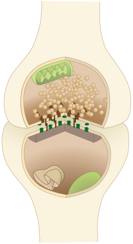


Later: presented with a pattern. Has it been seen before?

Compare $\vec{s} \cdot \vec{w}(t)$ to threshold. [Sommer and Dayan (1998)]

$$\mathrm{SNR}(t) = \frac{\langle \vec{s}\cdot\vec{w}(t)\rangle - \langle \vec{s}\cdot\vec{w}(\infty)\rangle}{\sqrt{\mathrm{Var}(\vec{s}\cdot\vec{w}(\infty))}}, \qquad \overline{\mathrm{SNR}}(\tau) = \int \mathrm{d}\tau \, \frac{\mathrm{e}^{-t/\tau}}{\tau} \, \mathrm{SNR}(t).$$

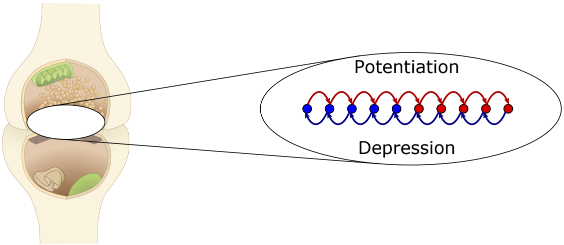
Models of complex synaptic dynamics



Models of complex synaptic dynamics

- Internal functional state of synapse → synaptic weight.
- Candidate plasticity events → transitions between states

● weak
● strong



States: #AMPAR, #NMDAR, NMDAR subunit composition,
CaMK II autophosphorylation, activating PKC, p38 MAPK,...

[Fusi et al. (2005), Fusi and Abbott (2007), Barrett and van Rossum (2008)]

Models of complex synaptic dynamics

Summary

- We have formulated a general theory of learning and memory with complex synapses.
- We find a memory envelope: a single curve that cannot be exceeded by the memory curve of *any* synaptic model.
- We understood which types of synaptic structure are useful for storing memories for different timescales.

Technical detail: ordering states

Let $\mathbf{T}_{ij}$ = mean first passage time from state i to state j. Then:

$$\eta = \sum_j \mathbf{T}_{ij}\mathbf{p}_j^\infty,$$

is independent of the initial state i (Kemeney's constant).

[Kemeny and Snell (1960)]

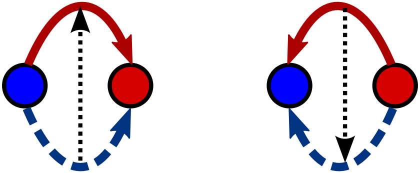
We define:

$$\eta_i^+ = \sum_{j\in\text{strong}} \mathbf{T}_{ij}\mathbf{p}_j^\infty, \qquad \eta_i^- = \sum_{j\in\text{weak}} \mathbf{T}_{ij}\mathbf{p}_j^\infty.$$

They can be used to arrange the states in an order (increasing η^- or decreasing η^+). back

Technical detail: upper/lower triangular

With states in order:



Endpoint: potentiation goes right, depression goes left.
