Mice with enhanced cerebellar plasticity can show both impaired and enhanced learning.

Simple synapses cannot explain behaviour.

 $\rightarrow$  Necessary & sufficient conditions on complex synapses to replicate this.

Impaired learning with enhanced plasticity

Introduction

- 1. It does help in some cases
- 2. Want to understand when and why
- 3. Depends on circumstance. Rich pattern of behaviour
- 4. Develop understanding of when and why learning is enhanced/impaired

### Outline

- Motor learning
  - Cerebellar learning of mice with enhanced plasticity
  - Complex synaptic models
- (Memory capacity of complex synapses)

Impaired learning with enhanced plasticity

#### Vestibulo-Occular Reflex

Impaired learning with enhanced plasticity

└─Vestibulo-Occular Reflex

Eye movements compensate for head movements to maintain fixation.

Requires control of VOR gain =  $\frac{\text{eye velocity}}{\text{head velocity}}$ .

Needs to be adjusted as eye muscles age, etc.

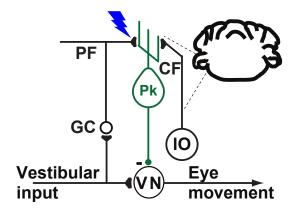

# VOR training

#### VOR Increase Training

#### VOR Decrease Training

Gain increase: LTD in PF-Pk synapses. Gain decrease: different mechanism,

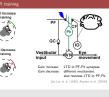

also reverses LTD in PF-Pk.

[du Lac et al. (1995), Boyden et al. (2004)]

July 26

Impaired learning with enhanced plasticity

—VOR training

- 1. trick brain into thinking VOR gain needs adjusting my moving visual stimulu
- 2.  $anti-phase \rightarrow increase gain$
- 3. in phase  $\rightarrow$  decrease gain
- 4. Gain change involves cerebellum
- 5. If we enhanced plasticity here: expect enhanced learning

# Enhanced plasticity impairs learning

Knockout of MHC-I D<sup>b</sup>K<sup>b</sup> molecules in PF-Pk synapses

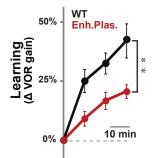

[McConnell et al. (2009)]

 $\rightarrow$  lower threshold for LTD  $\rightarrow$  enhanced plasticity

Hypothesis: enhanced learning.

VOR Increase Training

**Experiment**: enhanced plasticity  $\rightarrow$  impaired learning.

Impaired learning with enhanced plasticity

-Enhanced plasticity impairs learning

- 1. Major Histocompatibility Complex involved in synaptic plasticity (Carla Shatz lab)
- 2. Easier LTD  $\rightarrow$  expect better learning
- 3. Impairment of learning
- 4. Looking at change of VOR gain during gain-up training

# Depletion hypothesis

Learning rate  $\sim$  intrinsic plasticity rate  $\times$  # synapses available for LTD.

Naive State	Normal Learning
Training —	
Mutation	
Training →	
Depleted State	Impaired Learning

Impaired learning with enhanced plasticity

Depletion hypothesis

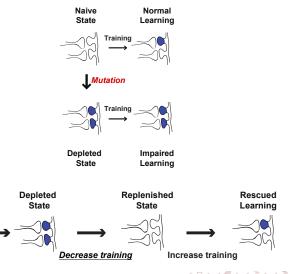

- 1. Our model: baseline activity ightarrow saturation ightarrow less depression possible
- 2. Saturation has to compete with enhanced plsaticity. Which will win?

2013-07-26

# Depletion hypothesis

Learning rate  $\sim$  intrinsic plasticity rate  $\times$  # synapses available for LTD.

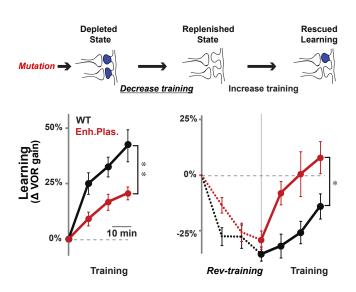

Impaired learning with enhanced plasticity 2013-07-26

-Depletion hypothesis

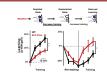

- 1. Our model: baseline activity  $\rightarrow$  saturation  $\rightarrow$  less depression possible
- 2. Saturation has to compete with enhanced plsaticity. Which will win?
- 3. Prediction: replenish with rev-training  $\rightarrow$  rescue

## Replenishment by reverse-training

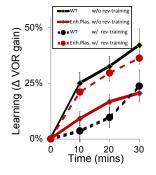

Impaired learning with enhanced plasticity

Replenishment by reverse-training

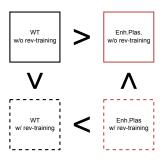

- 1. precede gain inc training w/ gain dec rev-training: reverses LTD
- 2. but behaviour from elsewhere  $\rightarrow$  not modelled
- 3. Focus on gain inc part

2013-07-26

- 1. Restricted to gain inc for comparison
- 2. Solid: no pre. Dashed: with pre
- 3. Initial slope only
- 4. Enh.Plas. hurts w/o. Competition?
- 5. Enh.Plas. helps w/. Expected

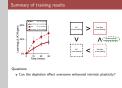

#### Questions:

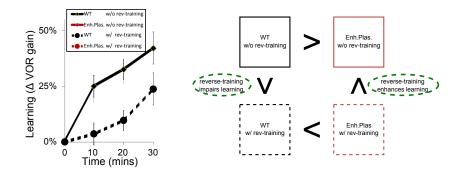

• Can the depletion effect overcome enhanced intrinsic plasticity?

Impaired learning with enhanced plasticity

Summary of training results

- 1. Restricted to gain inc for comparison
- 2. Solid: no pre. Dashed: with pre
- 3. Initial slope only
- 4. Enh.Plas. hurts w/o. Competition?
- 5. Enh.Plas. helps w/. Expected
- 6. now we can compare w/o, w/rev
- 7. rev helps Enh.Plas. as expected

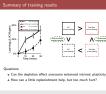

#### Questions:

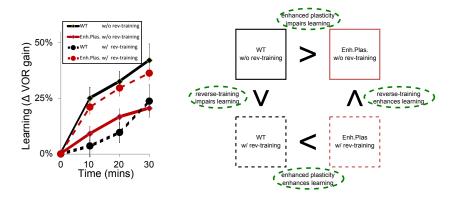

- Can the depletion effect overcome enhanced intrinsic plasticity?
- How can a little replenishment help, but too much hurt?

Impaired learning with enhanced plasticity

—Summary of training results

- 1. Restricted to gain inc for comparison
- 2. Solid: no pre. Dashed: with pre
- 3. Initial slope only
- 4. Enh.Plas. hurts w/o. Competition?
- 5. Enh.Plas. helps w/. Expected
- 6. now we can compare w/o, w/rev
- 7. rev helps Enh.Plas. as expected
- 8. but rev hurts WT. Question

#### Questions:

- Can the depletion effect overcome enhanced intrinsic plasticity?
- How can a little replenishment help, but too much hurt?

Impaired learning with enhanced plasticity

Summary of training results

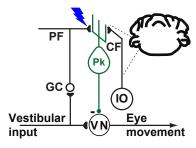

- 1. Restricted to gain inc for comparison
- 2. Solid: no pre. Dashed: with pre
- 3. Initial slope only
- 4. Enh.Plas. hurts w/o. Competition?
- 5. Enh.Plas. helps w/. Expected
- 6. now we can compare w/o, w/rev
- 7. rev helps Enh.Plas. as expected
- 8. but rev hurts WT. Question
- 9. Summarize: Enh.Plas. can impair/enhance. Rev can impair/enhance
- $10.\,$  Diagonal comparisons: parameter fitting. Depend on size of mut vs. rev

## Behaviour to synapses

# VOR Increase Training

Impaired learning with enhanced plasticity

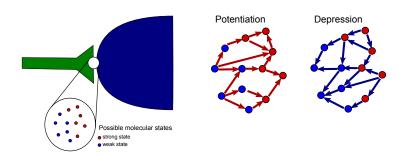

Behaviour to synapses

1. Focus on synapses. See if we can understand this behaviour.

## Complex synapses

#### Assumptions:

- Candidate plasticity events occur independently at each synapse,
- Each synapse responds with the same state-dependent rules,
- Keep track of distribution of synapses across states.

[Fusi et al. (2005), Fusi and Abbott (2007), Barrett and van Rossum (2008)]

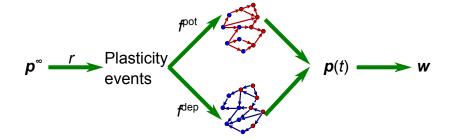

Impaired learning with enhanced plasticity

Complex synapses

- 1. Not just synaptic weight, internal dynamical system
- Important for memory: simple synapses terrible storage, rescued by complexity
- 3. Multiple functional states w/ different weights
- 4. Stochastic transitions between states
- 5. allows us to concentrate on synapse, not neuron/network
- 6. This is a question about synaptic populations after all.

# Models of synaptic dynamics

Impaired learning with enhanced plasticity

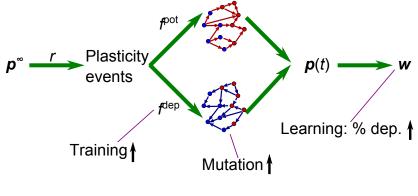

2013-07-26

☐ Models of synaptic dynamics

- 1. stoch process has steady state distribution.
- 2. Prior activity puts it in this state. row vec.
- 3. plasticity events at rate r
- 4. fraction pot/dep
- 5. probs changed by Markov matrices, prob i 
  ightarrow j
- 6. Readout: synaptic weight vec when in each state.

# Models of synaptic dynamics

 $PF+\mathscr{L}F \rightarrow LTP$ ,  $PF+CF \rightarrow LTD$ .

Lower threshold for LTD

VOR gain increase

<ロト < 回 ト < 亘 ト < 亘 ト → 亘 ・ 夕 Q ()

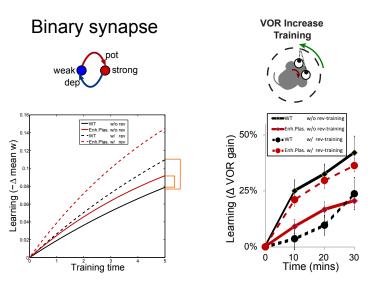

Impaired learning with enhanced plasticity

☐ Models of synaptic dynamics

- 1. stoch process has steady state distribution.
- 2. Prior activity puts it in this state. row vec.
- 3. plasticity events at rate r
- 4. fraction pot/dep
- 5. probs changed by Markov matrices, prob  $i \rightarrow j$
- 6. Readout: synaptic weight vec when in each state.
- 7. Mutation: lower threshold  $\rightarrow$  increase transition probs
- 8. Training: Changes statistics of LTP/LTD. Only parameters we have. Don't care about *r*.
- 9. Learning: Only output we have. Don't keep track of synaptic identity.

## Simple synapses cannot explain the data

Impaired learning with enhanced plasticity

—Simple synapses cannot explain the data

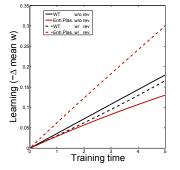

- 1. Binary fails mathematical proof for any params
- 2. Enh.Plas: faster depression wins over bias
- 3. pre: reduces/reverses bias. always helps.

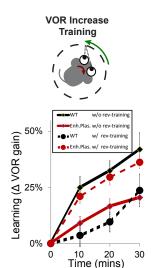

2013-07-26

# Complex synapses can explain the data

#### Serial synapse

[Leibold and Kempter (2008)]

Impaired learning with enhanced plasticity

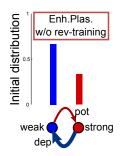

Serial synapse

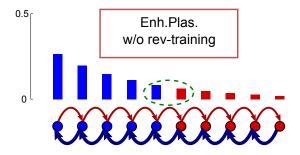

-Complex synapses can explain the data

- 1. Serial: still only two weights. Works.
- 2. Understand by looking at distributions before training

2013-07-26

# Enhanced plasticity can enhance or impair learning

Intrinsic plasticity dominates depletion

the enhanced plasticity enhances learning

Depletion dominates intrinsic plasticity

enhanced plasticity impairs learning

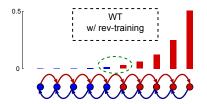

Impaired learning with enhanced plasticity

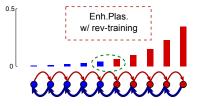

-Enhanced plasticity can enhance or impair learning

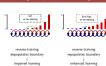

- 1. Binary: enhanced plasticity  $\rightarrow$  bias
- 2. Not enough to overcome faster depression
- 3. Serial: Only get signal from boundary
- 4. Exponential decay depopulates boundary, enhances effect of bias

# Reverse-training can impair or enhance learning

reverse-training depopulates boundary impaired learning reverse-training repopulates boundary the enhanced learning Impaired learning with enhanced plasticity

-Reverse-training can impair or enhance learning

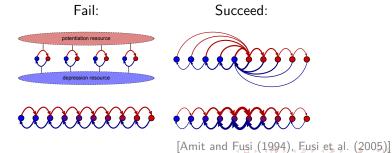

- 1. rev-training: little repopulates boundary
- 2. Too much pushes to other side, depopulates boundary
- 3. this effect is absent in any simple synapse

#### Essential features

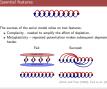

The success of the serial model relies on two features:

- Complexity needed to amplify the effect of depletion,
- Metaplasticity repeated potentiation makes subsequent depression harder.

Essential features

- 1. due to exponential decay
- 2. push away from boundary where signal generated
- 3. borne out by other models that fail/succeed

#### Conclusions

- - Reverse-training  $\rightarrow$  enhance/impair learning depending on plasticity rates.
- We can explain these behavioural patterns using synaptic models.
- Key required synaptic properties are:
   Synaptic complexity: necessary to amplify depletion.
   Synaptic stubbornness: repeated potentiation makes subsequent depression harder.
- We used behaviour to constrain the dynamics of synaptic plasticity

Impaired learning with enhanced plasticity

└─Conclusions

clusions

We find diverse behavioural patterns in these mutant mice.

- Enhanced plasticity → enhance/impair learning depending on prior experience. Reverse-training → enhance/impair learning depending on plasticit rates.
- We can explain these behavioural patterns using synaptic model
- Key required synaptic properties are:
   Synaptic complexity: necessary to amplify depletion.
- Synaptic complexity: necessary to among capacities.

  Synaptic stubborness: repeated potentiation makes subsequen degression harder.
  - . We used behaviour to constrain the dynamics of synaptic plasticit

# Tradeoff: learning vs. remembering

#### What about memory?

• Simple synapses have poor memory storage capacity. Synaptic complexity is needed for rescue.

[Amit and Fusi (1992), Amit and Fusi (1994)]

- Trade-off between learning and remembering: Too rigid  $\rightarrow$  difficult to learn new memories. Too plastic  $\rightarrow$  new memories quickly overwrite old.

[Lahiri and Ganguli (submitted)]

Impaired learning with enhanced plasticity

Fradeoff: learning vs. remembering

hat about memory?

Simple synapses have poor memory storage capacity.
 Synaptic complexity is needed for rescue.
 [Annit and Faul (1992). Amit and Faul (1992).

Trade-off between learning and remembering:
 Too rigid → difficult to learn new memories.
 Too plastic → new memories quickly overwrite old.

[Lahiri and Ganguli (s

# The frontiers of complex synaptic memory

We have N synapses with M internal states each.

We study the decay of one memory over time due to corruption by subsequent memories.

We prove that, no matter what the structure, no synaptic model can have:

- initial fidelity (SNR) greater than  $\sqrt{N}$ .
- memory lifetime greater than  $\sim \sqrt{N}M$ .
- fidelity decay slower than  $\sim \sqrt{N}M/t$ .

At late times, fidelity is maximised by a model with a simple chain structure.

4 D > 4 D > 4 E > 4 E > E 990

Impaired learning with enhanced plasticity

The frontiers of complex synaptic memory

frontiers of complex synaptic memory

N synapses with M internal states each.

We study the decay of one memory over time due to corruption by

We prove that, no matter what the structure, no synaptic model can have

 $\bullet$  initial fidelity (SNR) greater than  $\sqrt{N}$ .

memory lifetime greater than ~ √NM.
 fidelity decay slower than ~ √NM/t.

fidelity decay slower than ~ √NM/t.

At late times, fidelity is maximised by a model with a simple chair structure.
